                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing grading, staging, monitoring and prognosing disease of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                       The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single exon nucleic acid probes for analyzing gene expression in human

The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipidaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                 Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match 100.0%; Score 18; DB 4; Length 600; Best Local Similarity 100.0%; Pred. Pools of cells were isolated from a GenomeScreen(TM) library. The
library of cells was generated by retroviral integration of a gene
tagging element consisting of: 1) A promoterless beta-lactamase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

CM3-GN0297-110101-607-£03 GN0297 Homo sapiens cDNA, mRNA sequence.
BIO51278
proceeded by a splice acceptor as a reporter for gene expression, 2) A promoter driving neomycin resistance followed by a splice donor to trap downstream exons. 3' RACE from neomycin gene was performed using total RNA from isolated pools. Output was shotgun cloned in pAmp-1 and used to transform DHS-alpha competent bacteria. 5' ends of reported sequences were immediately preceded by splice donor from the trapping construct.

/note="Organ: Prostate; Vector: pT7T3 Pac; Site_1: EcoR I; Site_2: Not I; The library was constructed according Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was size fractionated on a 1% agarose gel. First strand cDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with Not I and then cloned directionally into pT7T3 Pac vector. The library tag sequence located between the Not I site and the polyA tail is CCCAC. Tissue was provided by Tim Ratlift."

Pools of cells were isolated from a GenomeScreen(TW) library. The library of cells was generated by retroviral integration of a gene tagging element consisting of: 1) A promoterless beta-lactamase proceeded by a splice acceptor as a reporter for gene expression; 2) A promoter driving neomycin resistance followed by a splice donor to trap downstream exons. 3' RACE from neomycin gene was performed using total RNA from isolated pools. Output was shotgun cloned in pAmp-1 and used to transform DH5-alpha competent bacteria. 5' ends of reported sequences were immediately preceded by splice donor from the trapping construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

/note="Organ: pancreas; Vector: pOTB7; Site_1: XhoI;
Site_2: ECoRI; cDNA made by oligo-dT priming.
Directionally cloned into EcoRI/XhoI sites using the birectionally cloned into EcoRI/XhoI sites using the following 5' adaptor: agGACAGAG(G). Size-selected >500bp for average insert size 1.8kb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-CDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH_MGC Library. |"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

This CDS clone is a part of a collection of human full length expression clones generated by BB Biosciences Clonnech and the expression clones generated by BB Biosciences Clonnech and the farvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall the clonin sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before 'ATG' to provide Kozak consensus sequence; 'GG' after last codon and before HindIII site to maintain reading frame. Clone distribution: http://bioinfo.clontech.com/orfclones.

RESULT 1

New antisense oligonuclectides inhibiting the anti-apoptotic protein bcl-xL, useful for reducing bcl-xL production in tumor cells to treat cancer or in vascular cells to promote the regression of vascular lesions. Anti-apoptotic protein; bcl-xL; tumour; cancer; epithelial; prostate; lung; bladder; bcl-2; vascular lesion; antisense; ss. Bcl-Xl mRNA specific antisense oligo K. (UYCO) UNIV COLUMBIA NEW YORK. 98US-00109614. Claim 1; Fig 1; 69pp; English 99WO-US015250. (first entry) WPI; 2000-137140/12. WO200001393-A2. Homo sapiens. 02-JUL-1999; 02-JUL-1998; 14-APR-2000 13-JAN-2000. AAZ46981; Stein CA;

The invention provides antisense oligonucleotides or their derivatives which reduce or eliminate expression of the anti-apoptotic protein bcl-xL. The oligonucleotides can be introduced into tumour calls to reduce bcl-xL production to treat cancer, especially epithelial cancer, e.g. prostate, lung or bladder cancer. Oligonucleotides comprising one or more bases with a C-5 propynyl pyrimidine modification may especially be used to reduce levels of bcl-2 family proteins (to which bcl-xL belongs) in such treatment. The oligonucleotides can be introduced into vascular cells to reduce bcl-xL production to promote the regression of vascular.

George medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising gross alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of mucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at

```
which comprises at least one carrier nucleic acid, at least 3 oligonucleotides, as primers and target-specific, fluorescently labeled probe and optionally at least one set of stabilized controls (standards RNA or DNA) of known concentration and instructions. The system comprises any of 20 sets of one control, two primers and one target-specific probe. The standardized polynucleotide system can be used for quantitative, realtime detection of target nucleic acids, especially analysis of genes or gene products, e.g. for individualized medical diagnosis, in veterinary medicine, functional genomics, clinical pharmacology, pharmacogenetics,
                                                                                                                                                                                ss; standardized polynucleotide system; medical diagnosis;

                                                                          ADK66037;
                      ADK66037/c
RESULT 3
```

expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids dequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of exon microarray for measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above mentioned amino acid

invention relates to a nucleic acid probe for measuring human gene

sequences (optionally with conservative amino acid substitutions), an stoolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing

The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The mucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data con this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence. The sequence contained in electronic format directly from USPTO at sequence.
                                                                                                                                                  ö
pharmaceutical testing, analysis of food or environmental samples and also for ultra-sensitive detection of proteins by immuno-PCR. The present sequence is a polynucleotide used in the system of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.

measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                         Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to single exon nucleic acid probes for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                       Probe #8448 used to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Probe #6802 for gene expression analysis in human heart cell sample.

                                                                                                                                                                                       ð
                                                                                                                             셤
                                                                                                                                                                                                                   ö
                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                               Human genome-derived single exon nucleic acid probes useful for analyzing

ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 1309 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be
brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from thuman lung compitising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes in the human lung, measuring gene expression in a sample acid expressed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (a) array; identifying exons in a eukaryotic genome, comprising (b) detecting specific hybridisation of detectably the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,

in the above mentioned microarray; profits assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the coposes, open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (LID), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-histicotycosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis, karagener syndrome, fibrocystic pulmonary displasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The sequence data for this patent did not form part of the printed sequence data for this patent did nelectronic format directly from MIPO specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gene expression; single exon probe; microarray;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 12
```

```
The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide agrenation, comprising any of the 6888 amino acid sequences in the specification, or their complements or fragments, and endoding at least 8 amino acids of any of the 6888 amino acid sequences ("LII) defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule cypression (comprising a plurality of single exon nucleic acid molecule active above, where each of the plurality of probes for measuring human calls or tissues. Also included are a spatially.

CC exon microarray for measuring human gene expression, a method of maddressably isolatable or amplifiable from the plurality, a single contiguous amino acids of any of the above-mentioned amino acid econtiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid soft accordance destring and/or licensing single exon probes or microarrays to a customer destring to measure gene expression, a method of providing soft accordance destring and/or licensing single exon probes or microarrays.

CC active above. The probes may be used as tools for surveying troage medium which contains a database having a plurality of records crited above. The probes may be used as tools for surveying a trasuse to detect the presence of expression of a single exon probe crited above. The probes may be used as tools for surveying alternation single exon, or in constructing genome-derived single exon microarrays.

CC in addition, the probes are used in identifying and characterising alternations in the genomic locument and

BH4-fused polypeptides with peptide sequences capable of exerting effect on enabling uptake into cells, applicable as effective apoptosis inhibitors, useful in preventives or remedies for ischemic diseases e.g. myocardial infarct.

Disclosure; Page 66-68; 84pp; Japanese

The present invention relates to BH4-fused polypeptides. The BH4-fused polypeptide have a sequence capable of affecting cellular uptake and also as BH4 domain sequence from an anti-apoptosis Bcl-2 family protein. The BH4-fused polypeptides are useful as effective apoptosis inhibitors, and are useful in preventives or remedies for ischaemic diseases e.g. myocardial infarct, AIDS, neurodegenerative diseases, infective multiple failure, fulminant hepatitis and diabetes. The present sequence is a mutant bcl-XL sequence which was used in the present invention. This sequence was derived from a human bcl-XL DNA sequence

```
This sequence represents the open reading frame of the mitochondrial cDNA clone HP03564. The protein encoded by this sequence was used in the method of the invention. The method allows detection of interactions between a protein X and a protein Y which has a reporter function in eukaryotic cells, and comprises modifying the localization patterns of X and/or Y, and the localization of Y in the cell is observed using the reporter function. This method is useful for the elucidation of protein networks within the cell. It is also applicable for the discovery of new proteins and low-molecular drugs, by observing their effect on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       intracellular protein interactions

Random oligonucleotide useful for detecting protein interaction, having base sequence, where each base of 1st and 2nd of the codon is the any of G, C,T (U), or A and the base of 3rd of codon is G or G, or G or T (U). Example 2; SEQ ID NO 3; 43pp; Japanese.

The invention relates to a novel random oligonucleotide having a base sequence where each base of the 1st and 2nd codon is any of ${\bf G}$, ${\bf C}$ T $({\bf U})$ or A and each base of the 3rd codon is ${\bf G}$ or C or T $({\bf U})$. The methods of the invention may be useful for preparing a random oligonucleotide preparation to be used for detecting protein interactions or for screening ligand or receptor protein binding sites. The current sequence is that of the human apoptosis inhibitory factor BCl-xL cDNA of the

/note="Organ: Stomach; Vector: pCNS; Site_1: EcoRI;
Site_2: NotI; The poly (A)+ RNA was dephosphorylated with
bacterial alkaline phosphatase (RAP) and then decapped
with tabacco acid pyrophosphatase (TAP). The decapped
inteat mRNA was ligated with DNA-RNA linker including EcoR
I site by treatment of T4 RNA ligase and the first strand
cDNA was synthesized from oligo dT-selected mRNA by.
priming with dT-tailed vector. The dT-tailed vector was
adjusted to have about 6 font. The cDNA vector was
circularized with E. coli DNA ligase after digestion of
EcoRI which site is also included in vector. An RNA strand

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          // CLOURS TILE - SONOWOOLD AND WAS DEPORTED IN CORE - O'CLOUR - ILLE - SONOWOOLD AND WAS DEPORTED AND WAS DEPORTED AND WITH LABORD AND WITH LABORD ALGE BARD AND CHARLING PHOSPHATASE (BAR) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact manna was ligated with DNA-RNA linker including ECOR I site by treatment of T4 RNA ligase and the first strand CDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt: The CDNA vector was circularized with E. coli DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli TOPLOF* by electroporation method. The CDNA libraries constructed by this method are full-length enriched CDNA library."

germ cell tumors, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pTyT3
vector. Library is normalized. Library was constructed by
Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi; Mammalla; Butheria; Primates; Catarrhini; Hominidae; Homo.
